

Assumption: We assume that the IFD is a flow of data **AFTER** the database and user interfaces have already been set up. As such, the IFD excludes loading of user data since this is mentioned as a DBA task that happens prior to use of this system. Additionally, we have assumed that the database will need to be read to load search prompts on the Add Resource (Primary ESF, Additional ESFs, Cost Type), Add Incident (Declaration) and Search for Resources (ESF, Incident) tasks.
